## **Selecting Profitable Hotel Sites**

 $\hfill\square$  Bookmark this page

Homework due Nov 24, 2020 07:59 +08 Past due selecting profitable hotel sites

La Quinta Motor Inns is a mid-sized hotel chain headquartered in San Antonio, Texas. They are looking to expand to more locations, and know that selecting good sites is crucial to a hotel chain's success. Of the four major marketing considerations (price, product, promotion, and location), location has been shown to be one of the most important for multisite firms.

Hotel chain owners who can pick good sites quickly have a distinct competitive advantage, since they are competing against other chains for the same sites. La Quinta used data on 57 existing inn locations to build a linear regression model to predict "Profitability", computed as the operating margin, or earnings before interest and taxes divided by total revenue. They tried many independent variables, such as "Number of hotel rooms in the vicinity" and "Age of the Inn". All independent variables were normalized to have mean zero and standard deviation 1.

The final regression model is given by:

Profitability = 39.05 - 5.41\*(State Population per Inn) + 5.86\*(Price of the Inn) - 3.09\*(Square Root of the Median Income of the Area) + 1.75\*(College Students in the Area)

The  $\mathbb{R}^2$  of the model is 0.51.

In this problem, we'll use this regression model together with integer optimization to select the most profitable sites for La Quinta.

### Problem 1.1 - Selecting the Most Profitable Hotels

1 point possible (graded)

According to the regression equation given above, which variables positively affect Profitability? Select all that apply.

State Population per Inn
☐ Price of the Inn ✔
Square Root of the Median Income of the Area
College Students in the Area

#### Explanation

The variables with positive coefficients in the regression equation positively affect profitability: Price of the Inn, and College Students in the Area.

#### Problem 1.2 - Selecting the Most Profitable Hotels

1 point possible (graded)

Using this regression equation, La Quinta created a spreadsheet model to predict profitability, and routing uses it to screen potential real estate acquisitions. Suppose that La Quinta is looking to expand their loca Calculator

in California, and has collected data for 16 different potential sites. This data is given in the spreadsheet SelectingHotels.ods for LibreOffice or OpenOffice, and SelectingHotels.xlsx for Microsoft Excel. For each hotel, it lists the location of the hotel, the price, and the value for each of the independent variables used in the regression equation (normalized to have mean zero and standard deviation one). Using the regression equation, what is the predicted profitability of hotel 1? Answer: 44.24 Explanation By substituting the data for hotel 1 into the regression equation, we get that: Profitability = 39.05 - 5.41\*(-1.00) + 5.86\*(-0.30) - 3.09\*(-0.81) + 1.75\*(-0.54) = 44.24Submit You have used 0 of 3 attempts Answers are displayed within the problem Problem 1.3 - Selecting the Most Profitable Hotels 1 point possible (graded) In your spreadsheet, compute the predicted profitability for all hotels. Which hotel has the highest predicted profitability? Hotel 2 Hotel 6 Hotel 7 Hotel 8 Hotel 12 Hotel 13 Explanation Hotel 2 has the highest predicted profitability of 53.38. This can be computed in the spreadsheet with as: 39.05 - 5.41\*(G5) + 5.86\*(D5) - 3.09\*(E5) + 1.75\*(F5) Submit You have used 0 of 1 attempt Answers are displayed within the problem Problem 1.4 - Selecting the Most Profitable Hotels 1 point possible (graded) Which hotel has the lowest predicted profitability? Hotel 2 Hotel 6 

O Hotel 7	
O Hotel 8 ✓	
O Hotel 12	
O Hotel 13	
Explanation  Hotel 8 has the lowest predicted profitability of 23.45.  This can be computed in the spreadsheet as:  39.05 - 5.41*(G11) + 5.86*(D11) - 3.09*(E11) + 1.75*(F11)

Answers are displayed within the problem
In this problem, we compared the greedy approach with an optimization approach, and saw that the optimization approach was much better. This is true in many situations, but not always. In which of the following situations would the greedy approach perform as well as the optimization approach? Select all that apply.  Instead of maximizing the sum of the profitability of the hotels we select, we wanted to maximize the average profitability of the hotels we select.
Instead of having a budget constraint, we had a constraint on the number of different hotels we can select (for example, we want to maximize profitability given that we can only select 2 hotels).
Instead of having a budget of \$10,000,000, we had a budget of \$20,000,000.
Explanation  If we want to maximize the average profitability, then it is always optimal to select the hotel that is the most profitable. Additionally, if we don't have a budget constraint, it is optimal to just select the two most profitable hotels. So in the first two situations, the greedy approach would perform as well as the optimization approach. In the third situation, the optimization approach would still perform much better than the greedy approach.
