## **Demographics and Employment in the United States**

☐ Bookmark this page

Homework due Sep 29, 2020 07:59 +08 Past due demographics and employment in the united states

In the wake of the Great Recession of 2009, there has been a good deal of focus on employment statistics, one of the most important metrics policymakers use to gauge the overall strength of the economy. In the United States, the government measures unemployment using the Current Population Survey (CPS), which collects demographic and employment information from a wide range of Americans each month. In this exercise, we will employ the topics reviewed in the lectures as well as a few new techniques using the September 2013 version of this rich, nationally representative dataset (available online).

The observations in the dataset represent people surveyed in the September 2013 CPS who actually completed a survey. While the full dataset has 385 variables, in this exercise we will use a more compact version of the dataset, CPSData.csv, which has the following variables:

**PeopleInHousehold**: The number of people in the interviewee's household.

**Region**: The census region where the interviewee lives.

**State**: The state where the interviewee lives.

**MetroAreaCode**: A code that identifies the metropolitan area in which the interviewee lives (missing if the interviewee does not live in a metropolitan area). The mapping from codes to names of metropolitan areas is provided in the file <a href="MetroAreaCodes.csv">MetroAreaCodes.csv</a>.

**Age**: The age, in years, of the interviewee. 80 represents people aged 80-84, and 85 represents people aged 85 and higher.

**Married**: The marriage status of the interviewee.

**Sex**: The sex of the interviewee.

**Education**: The maximum level of education obtained by the interviewee.

Race: The race of the interviewee.

**Hispanic**: Whether the interviewee is of Hispanic ethnicity.

**CountryOfBirthCode**: A code identifying the country of birth of the interviewee. The mapping from codes to names of countries is provided in the file <u>CountryCodes.csv</u>.

**Citizenship**: The United States citizenship status of the interviewee.

**EmploymentStatus**: The status of employment of the interviewee.

**Industry**: The industry of employment of the interviewee (only available if they are employed).

Answer: 131302

## Problem 1.1 - Loading and Summarizing the Dataset

1 point possible (graded)

Load the dataset from <u>CPSData.csv</u> into a data frame called CPS, and view the dataset with the summary() and str() commands.

Explanation
You can load the data with:
CPS = read.csv("CPSData.csv")

How many interviewees are in the dataset?

**⊞** Calculator

Submit You have used 0 of 3	
	3 attempts
Answers are displayed with	nin the problem
Problem 1.2 - Loading a	nd Summarizing the Dataset
point possible (graded) Among the interviewees with a verployment? Please enter the n	value reported for the Industry variable, what is the most common industry of ame exactly how you see it.
	Answer: Educational and health services
	ders the levels of a factor variable like Industry from largest to smallest, so we ealth services" is the most common Industry. table(CPS\$Industry) would have all industries.
Submit You have used 0 of 2	2 attempts

Problem 2.2 - Evaluating Missing Values  1 point possible (graded)  Often when evaluating a new dataset, we try to identify if there is a pattern in the missing values in the dataset. We will try to determine if there is a pattern in the missing values of the Married variable. The function is.na(CPS\$Married) returns a vector of TRUE/FALSE values for whether the Married variable is missing. We can see the breakdown of whether Married is missing based on the reported value of the Region variable with the function table(CPS\$Region, is.na(CPS\$Married)). Which is the most accurate:
The Married variable being missing is related to the Region value for the interviewee.
The Married variable being missing is related to the Sex value for the interviewee.
The Married variable being missing is related to the Age value for the interviewee.
The Married variable being missing is related to the Citizenship value for the interviewee.
The Married variable being missing is not related to the Region, Sex, Age, or Citizenship value for the interviewee.

with the following commands: table(CPS\$Region, is.na(CPS\$Married))
table(CPS\$Sex, is.na(CPS\$Married)) table(CPS\$Age, is.na(CPS\$Married))
table(CPS\$Citizenship, is.na(CPS\$Married))
For each possible value of Region, Sex, and Citizenship, there are both interviewees with missing and non-missing Married values. However, Married is missing for all interviewees Aged 0-14 and is present for all
interviewees aged 15 and older. This is because the CPS does not ask about marriage status for interviewees
14 and younger.

Droblem 2.4 - Evaluating Missing Values
Problem 2.4 - Evaluating Missing Values
1 point possible (graded)
Which region of the United States has the largest proportion of interviewees living in a non-metropolitan area?
Midwoot
Northeast
South
West
O West
₩ Calo

#### Explanation

To evaluate the number of interviewees not living in a metropolitan area, broken down by region, we can run table(CPS\$Region, is.na(CPS\$MetroAreaCode)). We can then compute the proportion of interviewees in each region that live in a non-metropolitan area: 34.8% in the Midwest, 21.6% in the Northeast, 23.8% in the South, and 24.4% in the West.

### Problem 2.5 - Evaluating Missing Values

#### 0.0/4.0 points (graded)

While we were able to use the table() command to compute the proportion of interviewees from each region not living in a metropolitan area, it was somewhat tedious (it involved manually computing the proportion for each region) and isn't something you would want to do if there were a larger number of options. It turns out there is a less tedious way to compute the proportion of values that are TRUE. The mean() function, which takes the average of the values passed to it, will treat TRUE as 1 and FALSE as 0, meaning it returns the proportion of values that are true. For instance, mean(c(TRUE, FALSE, TRUE, TRUE)) returns 0.75. Knowing this, use tapply() with the mean function to answer the following questions:

Which state has a proportion of interviewees living in a non-metropolitan area closest to 30%?

	Answer: Wisconsin
Which state has the largest propo interviewees were non-metropolis	ortion of non-metropolitan interviewees, ignoring states where all tan?
	Answer: Montana

#### Explanation

The correct way to invoke tapply to answer these questions is:

tapply(is.na(CPS\$MetroAreaCode), CPS\$State, mean)

It is actually easier to answer this question if the proportions are sorted, which can be accomplished with: sort(tapply(is.na(CPS\$MetroAreaCode), CPS\$State, mean))

From this output, we can see that Wisconsin is the state closest to having 30% of its interviewees from a nonmetropolitan area (it has 29.933% non-metropolitan interviewees) and Montana is the state with highest proportion of non-metropolitan interviewees without them all being non-metropolitan, at 83.608%. Answering each of these questions would have been tedious using the table() output.

#### Problem 3.1 - Integrating Metropolitan Area Data

2 points possible (graded)

Codes like MetroAreaCode and CountryOfBirthCode are a compact way to encode factor variables with text as their possible values, and they are therefore quite common in survey datasets. In fact, all but one of the variables in this dataset were actually stored by a numeric code in the original CPS datafile.

When analyzing a variable stored by a numeric code, we will often want to convert it into the values the codes represent. To do this, we will use a dictionary, which maps the the code to the actual value of the variable. We have provided dictionaries MetroAreaCodes.csv and CountryCodes.csv, which respectively map MetroAreaCode and CountryOfBirthCode into their true values. Read these two dictionaries into data frames MetroAreaMap and CountryMap.

Explanation	
This can be	read from str(MetroAreaMap) or nrow(MetroAreaMap).
How many c	bservations (codes for countries) are there in CountryMap?
	Answer: 149
Explanation This can be	read from str(CountryMap) or nrow(CountryMap).

ı poını possible (graded)

We can read from the sorted output that Honolulu, HI; San Francisco-Oakland-Fremont, CA; San Jose-Sunnyvale-Santa Clara, CA; and Vallejo-Fairfield, CA had at least 20% of their interviewees of the Asian race

Answers are displayed within the problem

### Problem 3.6 - Integrating Metropolitan Area Data

1 point possible (graded)

Normally, we would look at the sorted proportion of interviewees from each metropolitan area who have not received a high school diploma with the command:

sort(tapply(CPS\$Education == "No high school diploma", CPS\$MetroArea, mean))

However, none of the interviewees aged 14 and younger have an education value reported, so the mean value is reported as NA for each metropolitan area. To get mean (and related functions, like sum) to ignore missing values, you can pass the parameter na.rm=TRUE. Passing na.rm=TRUE to the tapply function, determine which metropolitan area has the smallest proportion of interviewees who have received no high school diploma.

	Answer: Iowa City, IA

#### Explanation

To obtain the sorted list of proportions by metropolitan area, we run: sort(tapply(CPS\$Education == "No high school diploma", CPS\$MetroArea, mean, na.rm=TRUE)) We can see that lowa City, IA had 2.9% of interviewees not finish high school, the smallest value of any metropolitan area.

### Problem 4.1 - Integrating Country of Birth Data

2 points possible (graded)

Just as we did with the metropolitan area information, merge in the country of birth information from the CountryMap data frame, replacing the CPS data frame with the result. If you accidentally overwrite CPS with the wrong values, remember that you can restore it by re-loading the data frame from CPSData.csv and then merging in the metropolitan area information using the command provided in the previous subproblem.

What is the name of the variable added to the CPS data frame by this merge operation?

	Answer: Country
How many interviewees have a mi	issing value for the new country of birth variable?
	Answer: 176

### Explanation

The merge operation in this case is

CPS = merge(CPS, CountryMap, by.x="CountryOfBirthCode", by.y="Code", all.x=TRUE)

From summary (CPS), we can read that Country is the name of the added variable, and that it has 176 missing values.

Problem 4.2 - Integrating Country of Birth Data
0.0/2.0 points (graded) Among all interviewees born outside of North America, which country was the most common place of birth?
Answer: Philippines
Explanation From the summary(CPS) output, or alternately sort(table(CPS\$Country)), we see that the top two countries of birth were United States and Mexico, both of which are in North America. The third highest value, 839, was for the Philippines.
Submit You have used 0 of 5 attempts
Answers are displayed within the problem
Problem 4.3 - Integrating Country of Birth Data
0.0/2.0 points (graded) What proportion of the interviewees from the "New York-Northern New Jersey-Long Island, NY-NJ-PA" metropolitan area have a country of birth that is not the United States? For this computation, don't include beople from this metropolitan area who have a missing country of birth.
Answer: 0.309
Explanation From table(CPS\$MetroArea == "New York-Northern New Jersey-Long Island, NY-NJ-PA", CPS\$Country != 'United States"), we can see that 1668 of interviewees from this metropolitan area were born outside the Jnited States and 3736 were born in the United States (it turns out an additional 5 have a missing country of brigin). Therefore, the proportion is 1668/(1668+3736)=0.309.
